

Aquabox to send much needed water filters to Venezuela.

Following the recent earthquake in Venezuela, affected communities continue to face significant humanitarian challenges, including disruption of water systems, damage to critical infrastructure, and limited access to safe drinking water.

Although the priority for national and international teams is still search and rescue it is now moving to the recovery phase where there is now a practical need for clean drinking water in the earthquake zones as much of the infrastructure has been destroyed including water and sewage treatment pipework.

La Guaira, Venezuela - June 25, 2026: The city damaged in the aftermath of powerful earthquakes.

Since the day the earthquake struck on 24th June, Derbyshire's Aquabox has been in contact with our partners on the ground, including the Venezuelan Red Cross, IFRC and

Airlink who are supporting emergency response operations to address immediate needs and strengthen community resilience during the recovery phase.

There are a number of customs protocols that overseas NGOs are required to go through with the Venezuelan Government before they can send aid into the country and we, alongside our partners, are currently going through this process.

Once these hurdles have been overcome and a secure supply route has been established, we will be sending our first shipment of 360 family and 10 community filters to the worst affected area, La Guaira state, which was the epicentre of the earthquake. This will support 8,500 people with clean, safe water.

Recent reports highlight that over 3,500 people have died, 10,500 injured with tens of thousands missing. There is major critical damage to infrastructure with over 96,000 buildings damaged or completely destroyed.

La Guaira as recovery efforts continue and testing the family filters before packing

10 x community filters ready for despatch - Packing 360 family filters
